# Sprint 3 Review

Sprint Goal

The Sprint 3 goal is to implement more advanced functionality of the app that has been built previously, with calendar integration, sharing features, and notably notification features. This sprint is also fix and improve previous features according to stakeholder's feedback. The app is also created to be available to Apple App Store and Google Play Store

Demos

▶ Mobile app demonstration

The backend and the web app are currently deployed on the client's AWS EC2 instance. The web app can be accessed through the link " 🌐 My Medical Secretary ". The mobile app cannot be deployed at this stage, as there are several issues to be fully published to Google Playstore and Apple Store. Given this, a video for mobile app is given above.

Demo	Feedback & next steps
Web App Resource	Good
Web App Message	Good
Web App Admin Control	Good
Login as Patient	Good
Home Screen Mobile App	Good
Appointments in Mobile App	Is it sharable for appointment details? Yes, then it is good
Messages in Mobile	Good
Linked Resources in Mobile	It would be good to be able to share resource → we don't have direct feature to share it, but because it is a link, it can be shared easily

Summary of Feedback

Susan's overall opinion was very positive for both web app and mobile app similar to previous sprint. She approve the simplistic UI and the Quality-of-Life improvement that had been made. Her only concerns and feedback were if the appointment details (which is indeed sharable) and resources are sharable. The resources are easily sharable with the embedded link, and with limited time available for sprint 4, and Susan didn't mind it, we don't implement a new feature for it.

Complete Tasks

- Login feature
- Appointment Files feature
- Notification feature
- Phone Calendar feature
- Appointment Mobile View Sorted feature
- Resource feature
- Mobile Appointment details feature
- Message feature
